## April 11, 2017, update for SharePoint Server 2013 (KB3178723)

This update contains the following improvements and fixes:

- Query completions aren't updated with new queries.

- For remote SharePoint calls in hybrid, the query rewrite in the result source is added to the query for two times. This could lead to an unexpected recall for custom query rewrites.

- Translates some terms in multiple languages to make sure that the meaning is accurate.

## April 11, 2017, update for Project Server 2013 (KB3191824)

This update contains the following improvements and fixes:

- You have a required custom field with a lookup table and with a default value defined. When you create a project through a project detail page, the custom field isn't pre-filled with the default value. Instead, you have to select a value from the dropdown manually.

- Screen readers don't identify that the **Delegate Name** and the **User Name** fields on the **Add Delegation** page are required.

- On the **Manage Queue Jobs** page, the dates in the **From** and **To** in the **Job History** section don't work as expected. For example, you may not be able to set a date in order to see jobs from previous days.

# April 11, 2017, update for SharePoint Server 2016 (KB3178718)

This update contains the following improvements and fixes for SharePoint Server 2016:

- When you start a crawl for a web application that's migrated from SharePoint Server 2013, the crawl fails, and the content isn't searchable. This issue occurs because the connector retrieves the TenantId property for two times.

- A new SPServer.CompliantWithMinRole property is added so that farm administrators can see the MinRole compliance status of each server in the farm without using Central Administration. You can see the server compliance status in Windows PowerShell by running:

  Get-SPServer | FT -Property Address, Role, CompliantWithMinRole

- Sometimes psconfig copies side-by-side files unnecessarily.

- Improves word breaking for Thai.

- Translates some terms in multiple languages to make sure that the meaning is accurate.

- When PSConfig runs its tasks, it first stops certain services on the local server, such as the SharePoint Timer service. If you click **Cancel** before the final task runs to the end, or if PSConfig encounters an unexpected exception, it won't automatically restart the services that it stopped.

- In an upgrade, the log file would record warnings about avoiding an attempt to change the database version because it recognizes that this can't be done. This log file message severity is now changed from warnings to information so that administrators don't think an invalid action was performed during an upgrade.

- Fix an issue about the compilation of search query completion dictionaries. Query suggestions timer job sometimes fails because of duplicate key constraint violation.

- If you have a SharePoint 2013 site that uses a Serbian language pack, the site fails to upgrade when you attach the content database to SharePoint Server 2016. This is fixed.

  **Note** Certain features in an upgraded Serbian site may not function correctly. This will be fixed in a future update.

  This update contains the following improvements and fixes for Microsoft Project Server 2016:

- When you browse PWA pages that have HTML grids either in Internet Explorer standards or enterprise mode, you can't scroll pages because the scroll bars don't appear.

- Screen readers don't identify that the **Delegate Name** and the **User Name** fields on the **Add Delegation** page are required.

## April 11, 2017, update for SharePoint Server 2016 (KB3178721)

- Translates some terms in multiple languages to make sure that the meaning is accurate.
