January 14, 2020, cumulative update for SharePoint Enterprise Server 2013 (KB4484232)

- This cumulative update package includes cloud hybrid search capability to SharePoint Server 2013. Learn about cloud hybrid search for SharePoint.

- This cumulative update package fixes the issues that are described in the following Microsoft Knowledge Base (KB) article:

January 14, 2020, update for SharePoint Foundation 2013 (KB4484233)

- This article describes update 4484233 for Microsoft SharePoint Foundation 2013 that was released on January 14, 2020.
- This update fixes the following issues:
- You are unable to access Office Add-Ins from a document that is opened in a browser when they are provided by the SharePoint App Catalog Service.
- Calendar overlay items that are listed under Calendars in View are not clickable.

January 14, 2020, update for SharePoint Enterprise Server 2016 (KB4484220)

- This update improves translations for multiple languages versions of SharePoint Server 2016.

January 14, 2020, update for SharePoint Enterprise Server 2016 (KB4484215)

This update improves the compliance level of cookies that are generated by a SharePoint search.

This update also fixes the following issues in SharePoint Server 2016:

- You are unable to access Office Add-Ins from a document that is opened in a browser when they are provided by the SharePoint App Catalog Service.

- When you log into SharePoint by using multiple authentication types at the same time such as a SAML token and a FedAuth cookie, the URL redirection happens to the root of the web application instead of the actual resource.

- Fixes an issue in the SharePoint eDiscovery Center portal where errors are produced when you export content from a site preservation hold library.

- When you create a new document in Word and try to save it to a document library with a content type that has required properties, you are blocked from saving because the Document Information Panel doesn't show required properties.

- Calendar overlay items that are listed under **Calendars in View** are not clickable.

This update also fixes the following issues in Project Server 2016:

- Fixes performance problems when you perform actions such as connecting Project to the server, trying to see a list of projects from the server, going to the Project Center page and so on.

- When the Schedule Variance Percentage (SVP) or Cost Variance Percentage (CVP) earned value becomes very large, this causes an overflow condition. It causes the client-side object model (CSOM) or REST calls to fail when you access the project. The SVP and CVP values now have a lower limit of "-100%" and upper limit of "100%".

This update improves the compliance level of cookies that are generated by a SharePoint search.

This update fixes the following issues in SharePoint Server 2019:

- When consuming an upgraded SharePoint 2019 User Profile Service from SharePoint 2016, admins are unable to create workflows that use the User Profile Data Source.

- When the Product Configuration Wizard runs, it re-creates the SharePoint firewall rules. If third-party firewall rules with the same name as the SharePoint rules exist, the Product Configuration Wizard removes them. This update resolves this issue.

- You are unable to access Office Add-Ins from a document that's opened in a browser when they are provided by the SharePoint App Catalog Service.

- After the ClearSyncDataForContentDatabase method is called, the User Profile Service Application sync job is unable to start again.

This update fixes the following issues in Project Server 2019:

- Loading a timesheet takes a long time and may time out.

- Resource calendars aren't updated correctly when a base calendar changes. This may cause the timephased actual work reported by a team member to appear on different days from where it was entered.

- You are unable to set the assignment Actual Cost field either as a timephased or scalar value through the client-side object model (CSOM).
